

Public Ticket Portal

Frazil Flow - integration & testing guide for the team
<https://flow.frazil.app/report>

The public intake portal lets **external or not-yet-logged-in users file tickets** directly into a team's roadmap - no login required. Submissions are protected by a CAPTCHA (Cloudflare Turnstile), a per-visitor rate limit, an optional per-team email-domain allowlist, and file-type/size limits on attachments. Each submission becomes a normal roadmap item (tagged `source=portal`) with the reporter's email captured for follow-up, a private status page, and email notifications.

PLANNED ROLLOUT - FN / IT REQUEST BUTTON

Repointing "FN / IT Request" to the Flow portal

Today, clicking **FN / IT Request** in Fraznet sends the user to <https://fraznet.com/internal-requests/new>. The plan is to **repoint that button to the new Flow report portal**, with the signed-in Fraznet user's email address embedded in the URL - so the reporter's email is filled in automatically and they land ready to file.

Before

<https://fraznet.com/internal-requests/new>

After

<https://flow.frazil.app/report?team=it&email={FraznetUser.email}>

Fraznet substitutes the logged-in user's email for `{FraznetUser.email}` (URL-encoded). Optionally add `&product=...` or `&type=...` to preselect more of the form. See **Part 1** for the full parameter list and encoding rules.

Part 1 - Launching the portal pre-filled (deep links)

When you open the portal **from another internal tool where the user is already signed in** (like the Fraznet FN/IT Request button), you can pre-fill the form by adding query parameters to the `/report` URL. This is how the reporter's email "comes from the URL" instead of being typed.

Parameters (all optional, all URL-encoded)

Parameter	Pre-fills	Notes
<code>email</code>	Your email + the "Email my tickets" box	Pre-filled but editable by the user (not locked).
<code>name</code>	Your name	Free text.

product	Project dropdown	Must exactly match (case-sensitive) a project the team exposes.
team	(disambiguates <code>product</code>)	Team slug. Only needed if the same project name is exposed by more than one team.
type	Type dropdown	Must match one of the team's offered types.
dept	Department dropdown	Must match one of the team/project's departments.
priority	Priority dropdown	2 = High, 3 = Medium, 4 = Low. Other values ignored (defaults to Medium).

Examples

The FN/IT Request rollout (carry the signed-in user's email into the IT team's portal):

```
https://flow.frazil.app/report?team=it&email=jane.doe%40frazil.com
```

A fully pre-filled Fraznet bug report:

```
https://flow.frazil.app/report?team=development&product=Fraznet&type=Bug&priority=2&email=jane.doe%40frazil.com
```

Building the link (URL-encode every value)

```
// JavaScript
const url = 'https://flow.frazil.app/report?' + new URLSearchParams({
  email:    currentUser.email,    // e.g. "jane.doe@frazil.com" -> encoded automatically
  name:     currentUser.fullName,
  team:     'it',
  priority: '3',                  // 2=High, 3=Medium, 4=Low
}).toString();
```

```
# Python
from urllib.parse import urlencode
url = "https://flow.frazil.app/report?" + urlencode({
  "email": user_email, "name": user_name, "team": "it",
})
```

Behavior & security notes

- **The email is a convenience pre-fill, not proof of identity.** The user can edit it, and the server does not verify ownership. Don't treat a portal ticket's reporter email as an authenticated identity.
- **The domain allowlist still applies.** If a team restricts domains, a pre-filled email on a non-approved domain is rejected on submit with a clear message.
- **CAPTCHA is still required** - pre-filling fields never skips the Turnstile check.
- `product` / `team` apply on load; `type` / `dept` apply *after* the project's config loads, so an invalid value for that project is simply ignored.

Part 2 - Testing the portal

Local setup

```
python server.py          # serves http://localhost:8000
# open http://localhost:8000/report
```

CAPTCHA in local/dev. Use Cloudflare's official test keys in your local `.env` so the widget always renders without a real Cloudflare site, then restart:

```
# .env (LOCAL / DEV ONLY - never use these in production)
TURNSTILE_SITE_KEY=1x00000000000000000000AA      # widget always PASSES
TURNSTILE_SECRET_KEY=1x00000000000000000000000000AA
```

Other Cloudflare test site keys: `2x00000000000000000000AB` (always blocks - test the failure path), `3x00000000000000000000FF` (forces an interactive challenge). To test with CAPTCHA *off*, leave both env vars unset - the widget and the server check both switch off.

Email in local/dev. Without SES configured, sending is a no-op (logged, not sent); watch the server log for `[Intake] reporter email sent ...`. Ticket creation still works fully.

Test checklist

A. Submission happy path

- ☐ Open `/report`, pick a Project, add a Summary + valid email, complete the CAPTCHA, Submit → success panel with a reference key and a "View your ticket" button.
- ☐ The new item appears in the app for that team with `source=portal` and the chosen Project / Type / Priority / Department and the reporter's name & email.

B. CAPTCHA (Turnstile)

- ☐ Submit without completing the widget → blocked ("please complete the verification").
- ☐ Direct API abuse: `POST /api/intake/{team}` with no token → HTTP 403 (enforced server-side, not just in the page).
- ☐ With the always-blocks test key, a completed-looking widget still fails server verification → 403.

C. Domain allowlist (Team Settings → Public Ticket Portal → Allowed email domains)

- ☐ Set e.g. `frazil.com`. Submit as `someone@gmail.com` → rejected (422). As `someone@frazil.com` → accepted. `x@mail.frazil.com` (subdomain) → accepted.
- ☐ Clear the field (blank) → any domain is accepted again.

D. Deep-link pre-fill (Part 1)

- ☐ Open `/report?email=jane%40frazil.com&name=Jane%20Doe&product=Fraznet&priority=2` → email, name, project, priority pre-selected.
- ☐ An invalid `product` / `type` in the URL is ignored (no crash, nothing pre-selected).

E. Attachments

- ☐ Attach a PNG/PDF under the size limit → recorded on the ticket. A disallowed type (e.g. `.exe`) → 415. Oversized → 413.

F. Confirmation & notification emails (needs SES)

- ☐ Reporter gets a “We’ve received your ticket” email with the Flow logo and a working status link.
- ☐ The team inbox (notification email, or a per-project override) gets a copy. Per-project override wins when set.
- ☐ Mark the ticket complete → reporter emailed. Defer it → reporter emailed.
- ☐ Add an internal comment mentioning `@reporter` → reporter emailed the note. (Type `@` on a portal ticket → “reporter” appears in the menu and inserts a blue chip.)

G. Reporter status page & reply thread (`/ticket`)

- ☐ The confirmation link opens a read-only status page (no internal fields like owner leak). The reporter can post a reply → it appears in the ticket’s conversation in-app, and the ticket’s owner/assignee get an in-app notification (plus the team email).

H. “My Tickets” self-service (`/my-tickets`)

- ☐ Use “Email my tickets” (or open `/my-tickets`) → enter an email → a private link is emailed listing only that email’s tickets.
- ☐ A bad/expired token → the friendly “request a link” landing, never someone else’s tickets.

I. Admin config persistence

- ☐ In Team Settings → Public Ticket Portal, change the toggle, notify email, offered Projects/Types, per-project emails, and domain allowlist → **refresh the browser** → every setting persists.

Production smoke test (after a deploy)

```
curl -s https://flow.frazil.app/api/version # expected app version
curl -s https://flow.frazil.app/report | grep -o turnstile # widget present when CAPTCHA is on
```

Then file one real test ticket end-to-end and confirm the confirmation email lands (check spam if the sending domain’s email authentication isn’t fully set up yet).

Reference - endpoints & config

Endpoint	Purpose
----------	---------

GET /report	The public submission page.
POST /api/intake/{team}	Create a ticket (CAPTCHA + domain + type/priority validated).
POST /api/intake/{team}/attach	Presigned S3 URL for an attachment.
GET /ticket?team=&id=&t=	Token-gated reporter status page.
POST /api/ticket-reply	Reporter posts a reply (token-gated).
GET /my-tickets?email=&t=	Token-gated list of a reporter's tickets.
POST /api/intake-track	Email a reporter their private My Tickets link.

Config (Team Settings → Public Ticket Portal): intakeEnabled, intakeProjects, intakeTypes, intakeNotifyEmail, intakeProjectEmails, intakeDomains. **Server env for CAPTCHA:** TURNSTILE_SITE_KEY, TURNSTILE_SECRET_KEY.
